

RusTab

Production of household chemicals since 2002

www.rustab.ru

Today RusTabExport is the largest producer of specialized household chemicals for dishwashers and laundry.

RusTabExport was founded in 2002 in St. Petersburg and confidently holds its position in the market, having survived many crises.

The modern high-tech and fully automated production facilities produce such well-known brands as Clean&Fresh, Aquarius, ECOlotta and many others.

All products are certified and undergo strict control from the development stages to product release.

The company has been working with many European brands for a long time. Based on their experience and technologies, RusTab creates products of the same quality as in Europe.

Responding to consumer demands and market trends, RusTabExport has a leading position among its manufacturing competitors.

Today the company can produce all known categories of tablets for dishwashers: eco tablets, premium tablets, tablets in water-soluble film.

We are particularly proud of the 10g mini tablets which were developed and launched in 2018. This is a unique development of RusTab engineers, which competing companies are only now trying to copy and replicate. The total capacity of the equipment allows us to produce up to 500 million tablets per year.

Clean&Fresh®

Aquarius®

ECOlotta®

5 levels of quality control of manufactured products.

Quality control is carried out at every stage of the production cycle, from incoming raw materials to the finished product. The Quality Assurance Manager has the authority to stop any production process if any deviation is detected.

The high quality of our goods is confirmed by the choice of consumers as well as numerous awards, such as Crystal Beauty and Kontrolnaya Zakupka ("Control Procurement"). The production is certified as per ISO9001-2015 and ISO14001-2015 eco standard.

In terms of consumer properties, our Clean&Fresh, Aquarius and ECOLotta brands are not inferior and for many parameters are even superior to the well-known global brands, at the same time being almost twice as cheap on the shelf.

Adapting to market conditions, ingredient and packaging analogues were found as quickly as possible. When selecting raw materials, the company seeks to choose only Russian producers. Suppliers are interested in co-operation with RusTabExport, a major producer, and that is why they ensure stable quality of incoming raw materials.

In this way, the warehouses are constantly stocked with the necessary inventory, which allows for uninterrupted deliveries.

In order to understand how a three-layer tablet works, you need to understand how a dishwasher works.

The dishwasher has several wash cycles:

- taking cold water from the mains, softening and heating it;
- pre-rinsing with heated water;
- washing with detergents (the same water is used, but purified);
- rinsing (the final one is with hot water);
- drying.

Builders of a modern dishwasher detergent. The dishwasher requires three categories of consumables for proper operation: detergents, rinse aids and special salt.

The first layer contains alkaline components that swell the dirt particles and remove remnants of grease, starch, protein, tea, coffee and other dirt from the dishes.

The second layer of the tablet contains a bleaching agent - it destroys traces of staining substances (e.g. tea) on dishes by oxidizing them. Enzymes act as catalysts and are most effective at temperatures around 50 °C. The main builders, surfactants and phosphates, disperse the dirt particles, i.e. separate them into the detergent solution, while preventing them from being re-deposited on the surface of the dishes.

The third layer of the tablet contains non-ionic surfactants, which come into play at the last stage of dishwashing - rinsing. They are designed to add luster to the surface of dishes and make drying easier. The mechanism of its action is called Carry Over Technology: the non-ionic surfactants released during the main wash stage stick to the dishes and the walls of the dishwasher, forming a thin layer that begins to partially dissolve during the intermediate rinse stage and continues to work actively during the main rinse stage.

Modern all-in-1 products contain a whole range of new additives, including, for example, detergent enhancers, protectors for glass and decorated dishes, and a silver corrosion inhibitor.

Glass protection is provided by divalent Zn^{2+} zinc ions which fill in irregularities on the glass surface and protect the glass from corrosion, extending the life of glass products.

Clean&Fresh®

Why do you need to use salt in your dishwasher?

Many people who use a dishwasher only use tablets.

Certainly the all-in-one tablets are multi-component and clean dishes well, leaving them shiny.

But in addition to tablets, the dishwasher, like any other appliance, needs special care.

Frequent use of the dishwasher and lack of proper maintenance will lead to build-up of limescale deposits and scale which will damage the parts of the dishwasher and cause it to break down.

Limescale, scale and white deposits may appear on the dishes, depending on the hardness of the water. In Russia, this is quite a popular and urgent problem. Unlike in Europe, every second family in Russia lives in a region with hard or moderately hard water.

Special dishwasher salt should be used to avoid breakage of and damage to the appliance.

The salt not only softens the water for better wash quality, but also keeps your dishwasher's ion exchanger in working order.

The water is fed through an ion exchanger which absorbs scale-forming dissolved Ca^+ ions from the water and replaces them with Na^+ ions. As a result, softened water enters the dishwashing chamber.

With soft water, less detergent is needed and scale and limescale form very slowly.

An important criterion when selecting salt is its purity, as foreign impurities can contaminate the ion exchange resin and render the ion exchanger unusable. Food salt may absolutely not be used. Although both types of salt are the same chemical compound, table salt is much finer and can clog the salt reservoir in the dishwasher and break it.

FOR WATER HARDNESS MORE
 THAN 3°ZH, USE:
 RINSE AID and SPECIAL SALT

PREVENT STREAKS
 AND WHITE SPOTS
